

## Creating a Host

### Introduction

With the help of Whois tool, you may obtain information concerning your domain, including DNS data. If you have a hosting service with OVH, your domain has the following DNS configuration:

- Primary DNS: dns15.ovh.net
- Secondary DNS: ns15.ovh.net

If you don't want this information to be visible in the Whois database, OVH proposes the creation of hosts, which will have the function of DNS. OVH's DNS won't be visible.

You may have the following data in Whois, for toto.com domain name:

- Primary DNS: dns.toto.com
- Secondary DNS: ns.toto.com

### To create a host

In order to be able to create a host, you need to first create an A field for it. Go to Manager, select a domain and choose "Domain & DNS" .

After 24 hours, you may create a host in the "GLUE Registry" section.

1. Log in to Manager
2. Select your domain from the menu on the left.
3. Click "Domain & DNS", then "GLUE Registry"
3. Choose "Create" and insert the name of the host, according to our example dns.toto.com, and enter the IP address (e.g. IP of our DNS: 213.186.33.102).
4. Click "Confirm button"
5. You may create also the other host (ns.toto.com) in this way.

After creating hosts you may change your domain's DNS.
