

## How to download/upload files?

- You shouldn't place your downloadable files in web space (<http://>). It's designed for fast requests. Downloading a file would use up all connections to web space and may result in a malfunction of the website in php/cgi/html.
- OVH offers Anonymous FTP, an option designed for downloading files where 1200 simultaneous connections are possible up to 20–30Mbs. Our Plan servers have this option. To get more information read AnonymousFTP.
- Placing downloadable files in web space may result in an intervention from our technicians if the website hosting account overloads the whole server and influences services of other users.
