

Installation of a domain on Secondary DNS

What for?

It's very important to have a reliable Secondary DNS in the other network than the Primary. OVH offers you such a service for free. Your domain need to have the following configuration:

- primary DNS: nsXXX.ovh.net (or the name of your server)
- secondary DNS: sdns1.ovh.net

You need to register your domain on sdns1.ovh.net to allow it to manage your domain.

How?

1. Log into Manager.
2. Select "Dedicated Server" section and then click the icon , select in the "Domain Management" section.
3. Click "New domain"
4. In the form that will appear insert the domain name without www at the beginning.
 - if you've registered a domain name with www or other prefix, you should delete it and register once more without prefix
 - if you have example.com domain name and 2 subdomains: test1.example.com and test2.example.com, you should register example.com only once.

After you fill in the form and activate the domain on sdns1.ovh.net, please modify domain's DNS to:

- nameofserver.ovh.net
- sdns1.ovh.net

If the domain is in OVH, you may do it in Manager, "Domain & DNS"
