

Pointing to DNS

Example:

If you order a hosting service at OVH but your domain name is located at another registrar. By configuring your DNS at your registrar, you will automatically take the configuration of our servers.

Steps

In order to point your domain to your website hosting in OVH, you need to change the domain DNS. To do so, please log into Manager.

Then choose your domain, and click "Domain & DNS" . Select the icon "DNS servers".

Enter the DNS of your host. OVH's DNS for shared hosting are as follows:

Primary DNS : dns14.ovh.net
IP : 213.251.188.133

Secondary DNS : ns14.ovh.net
IP : 213.251.128.133

The DNS propagation takes in general 24h/48h. Reminder: the previous OVH's DNS were:

Primary DNS : dns10.ovh.net
IP : 213.251.188.129

Secondary DNS : ns10.ovh.net
IP : 213.251.128.129

The configuration on these servers remain valid if the zone has been activated before the setting of dns14.ovh.net and ns14.ovh.net. Any new domain installed on OVH's DNS are automatically configured on dns14.ovh.net and ns14.ovh.net.
